

Let us bring the inspection lab to you!

Do you need to measure large parts that cannot be easily moved, or parts that cannot leave your facility? J.A. King can help! Our metrologists will bring a portable CMM to your facility to inspect your large and hard to move parts.

Trained J.A. King metrologists will inspect your parts and provide data without your parts ever leaving your facility. Our lightweight and versatile ROMER Arm is portable and can be set up wherever your part is located to provide repeatable 3D measurement.

Portable measuring arms are ideal for large and/or heavy equipment that needs to be measured at your facility. However, because the most accurate measurements are possible in a controlled lab environment there are some things to consider before choosing on-site inspections.

[LEARN MORE](#)

If you need extremely accurate measurements, the ROMER Arm may not be the best solution. Traditional CMMs and video measurement equipment are much more accurate and are recommended for parts that can be shipped to our inspection labs and applications that require a very high degree of accuracy. To determine if on-site inspections with our ROMER Arm are right for your application, contact us today.
