

J.A. King Temperature Calibration

Temperature is one of the most commonly measured variables in chemical production. Accurate temperature measurement plays a critical role in process and quality control. Therefore, temperature devices should be calibrated periodically to ensure precision as they are prone to measurement drift over time.

From temperature transmitters, to ovens and dry block calibrators J.A. King's [ISO 17025 accredited temperature calibration](#) services ensure your devices are performing accurately.

We offer the convenience of on-site calibration for many temperature devices including ovens, RTDs, and temperature controllers in addition to our in-lab calibration capabilities. All calibrations are tracked in our award-winning [GageSuite](#) system for easy access to your calibration documentation.

Whether you have one laboratory oven or 50 temperature transmitters, the experts at J.A. King can meet your temperature calibration needs.
