**J.A. King makes sure you're always in the right place  
at exactly the right *time!***

Distance, Rate, Speed and Time are essential measurements in many processes including:

- Knowing how fast your conveyor is moving or how much product has moved
- Products sold by length, like non-wovens or textiles
- Blending systems which call for an exact mixing rates or speed
- Products manufactured or tested using a centrifuge

Any variation from the specified speed can result in bad product, lost revenue or non-compliance with quality systems.

If you're not currently measuring your FPM's, YPM's and RPM's, J.A. King can provide a contact or non-contact solution from brands like Shimpo, Monarch, and Ametek. Regardless of the brand, J.A. King can keep your speed controls working as accurately as possible with regular calibration.

J.A. King can also come on-site and calibrate your mixers, blenders, counters and timers. Recipes are created with a certain mixing speed for a certain time. Any deviation from configured controls can result in poor quality products, excess waste and will certainly be non-compliant with your quality system.

Let J.A. King make sure you're running at exactly the right speed, but don't forget to have your timers calibrated too.

J.A. King Tachometer Calibration

Benjamin Franklin said, "Lost time is never found again." This is just as true in manufacturing as it is in life. Don't let your time get away from you - let J.A. King help you measure and calibrate your speed devices.
