

Bringing Calibration to You

Routine welder calibration is necessary for the optimal strength and quality of your welds. Calibration helps you avoid costly mistakes and deliver the high quality welds your customers expect.

For example, welding amperage that is too low can result in overlap, but amperage that is too high can lead to porosity. Calibration ensures that your welder voltage and amperage are within tolerance.

J.A. King provides the welder calibration you need to maintain the accuracy of your machines. Our technicians perform the calibrations on-site at your facility. Calibrations are NIST-traceable and tracked in our award-winning GageSuite system. We can calibrate various types of welders including MIG, TIG, and stick from multiple manufacturers.

Let J.A. King help maintain the integrity of your welds, contact us today.
